

Audio-Video Controllers

These are electronic controllers for seamless control of audio and video streams in Showrooms, Malls, Hotels, Offices, Homes and Apartment Blocks. Through such controls, the same music and audio-video signals, streamed from one source can be distributed to multiple sources and controlled with simple hand held remote controllers for easy viewing on the move or for multiple clients.

Systems are also integrated or separately provided for lighting controls to alter the intensity of multiple light sources. These can also switch lights on and off with ease, from a remote location as required in auditoriums or with a hand held wireless or infra-red keypad inside individual rooms. They can help reduce electricity bills and regulate misuse. Special dome audio listening stations can also be provided for CD and DVD Audio Shops.

As these systems have many options, they have to be custom sourced and integrated into appropriate professional systems to meet customer needs.
